

Grader,

Unfortunately this MP is not in the state I'd like it to be in. I've spent too much time trying to get the MP3 part of the code to work correctly and have exhausted my ability to work on it (and the time to).

I am turning this MP code in as-is to get any credit you may deem it worthy of, if any.

Given the time and mental capacity, I would implement the VM pool using linked lists for allocated and free lists, iterating through it to find the smallest large enough free segment when allocating, popping it out and connecting the previous node to the next node. And then the reverse for freeing it.
